Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Currently Amended) A method for integrating time division duplex (TDD) and frequency division duplex (FDD) in wireless communication systems, the method comprising the steps of:

receiving radio access bearer (RAB) requests at a radio network controller (RNC) along with a plurality of parameters regarding the request;

estimating at the RNC a <u>degree of symmetry in differential of data-rates</u> between uplink (UL) and downlink (DL) connections required to support communication associated with the RAB requests;

selecting either a TDD connection for both UL and DL or a FDD connection for both the UL and DL based on the estimated symmetry of differential of data rates between the UL and DL connections, wherein a difference is calculated between a data rate on the uplink and a data rate on the downlink and TDD is selected where said difference is greater than a predetermined threshold and FDD is selected where the difference is not greater than the predetermined threshold.

2. (Cancelled)

Applicants: Desgagne et al. Application No.: 10/828,665

3. (Original) The method of claim 1 wherein FDD connection is selected for RAB requests associated with voice applications.

4. (Original) The method of claim 1 further comprising:

evaluating a symmetry status of the UL and DL connections periodically once an initial connection has been established in response to a RAB request; and switching between TDD and FDD modes based on said symmetry status.

- 5. (Original) The method of claim 1 wherein all RAB requests are processed through a FDD RNC.
- 6. (Previously Presented) The method of claim 5 wherein only the FDD RNC is connected to a core network through an Iu interface, and a TDD RNC is indirectly connected to the core network through the FDD RNC.
- 7. (Original) The method of claim 6 wherein the FDD RNC performs all call connections and disconnections.
- 8. (Currently Amended) A system for integrating TDD and FDD in a communication system, the system comprising:

Applicants: Desgagne et al. Application No.: 10/828,665

a time division duplex radio network controller (TDD RNC);

a frequency division duplex radio network controller (FDD RNC); and,

a TDD-FDD selector configured to receive a RAB request and to estimate a

differential symmetry of data rates between uplink (UL) and downlink (DL)

connections that is required to support the RAB assignment request and to

calculate a difference between a data rate on the uplink and a data rate on the

downlink, and to make a decision to assign radio resources in either TDD mode for

both UL and DL or FDD mode for both UL and DL based on the estimated

differential symmetry of data rates between UL and DL connections, wherein TDD

is selected where the difference of data rates between UL and DL connections is

greater than a threshold and FDD is selected where the difference of data rates

between UL and DL connections is not greater than the threshold.

9. (Cancelled)

a core network (CN);

10. (Original) The system of claim 8 wherein a FDD connection is selected for

RAB requests associated with voice applications.

- 4 -

Applicants: Desgagne et al. Application No.: 10/828,665

11. (Original) The system of claim 8 wherein the TDD RNC, the FDD RNC,

and the TDD-FDD selector are integrated into an integrated TDD/FDD RNC.

12. (Original) The system of claim 8 wherein the FDD RNC includes a TDD

serving radio network controller (S-RNC) and is configured to support TDD Iur

protocols.

13. (Original) The system of claim 12 wherein only the CN and the FDD RNC

are connected via an Iu interface and RAB requests are processed through the FDD

RNC.
